

NQRUST-IDENTITY

One Identity | Every Access

A self-hosted Identity and Access Management platform — SSO, MFA, and role-based authorization for all your applications. Built on OIDC, OAuth 2.0, and SAML 2.0, deployed entirely on your own infrastructure with full data sovereignty.

INTRODUCTION

What Is NQRust-Identity?

A self-hosted Identity and Access Management (IAM) platform that centralizes authentication, authorization, and user management for all your applications.

NQRust-Identity is a **sovereign IAM platform** that acts as a centralized authentication server for your entire application ecosystem. Users authenticate once and gain seamless access to all connected applications through **Single Sign-On**. Built on industry-standard protocols — OAuth 2.0, OpenID Connect, and SAML 2.0 — it provides secure authentication without requiring developers to implement complex security logic in every application.

The platform includes **NQRust Auth** — our first-party mobile authenticator app for TOTP/HOTP MFA — alongside an **Identity Portal** for user lifecycle management with self-service capabilities for password reset, profile updates, and MFA enrollment. Deployment runs entirely on your own infrastructure via Docker Compose, with online and air-gapped TUI installer options.

CORE CAPABILITIES

Single Sign-On (SSO)

Users log in once and access all connected applications without re-authenticating. Supports web, mobile, and API clients. Eliminates login fatigue, reduces password reuse, and centralizes session management. Token-based security using JWT.

Authentication & MFA

Username or password authentication with MFA via **NQRust Auth** — our first-party Android authenticator supporting TOTP/HOTP. Argon2/PBKDF2 password hashing. Short-lived access tokens with rotating refresh.

Authorization & RBAC

Role-Based Access Control with policies per application. Centrally manage who can access what — enforced consistently across all services connected to the identity platform.

ONE STACK. FOUR COMPONENTS.

Identity Server

Core engine. Handles login, session management, SSO, and industry-standard authentication protocols.

Identity Portal

Unified web portal for easy user access and full admin visibility across the identity stack.

NQRust Auth

First-party mobile app for secure, independent verification codes — OTP, TOTP, and HOTP.

NQRust Installer

Flexible deployment engine for on-premise and air-gapped installations.

Deployment Options

Docker & Kubernetes

Deploy via **Docker container** or **Kubernetes Operator** with Helm charts. High-availability clustering with distributed caching for session replication across multiple instances. Auto-scaling with Kubernetes HPA. Supports PostgreSQL, MySQL, MariaDB, Oracle, and MS SQL as backend databases.

On-Premise & Air Gapped

Full self-hosted deployment on your own infrastructure. All user data, tokens, and configurations stay on-premise. **No external dependencies** after deployment. Import and export realms as JSON for backup, migration, and automated provisioning across environments.

Platform Capabilities

Features That Secure Your Organization

Enterprise-grade IAM capabilities — from SSO to fine-grained authorization policies.

Single Sign-On

Login once, access everything. Supports web, mobile, and API clients. Token-based sessions with configurable expiration and rotating refresh tokens.

NQRust Auth MFA

First-party mobile authenticator app. TOTP/HOTP MFA with AES-256 encrypted backup, PIN lock, and offline-first operation. Distributed with every NQRust-Identity subscription.

Identity Brokering

Authenticate via any external OIDC or SAML 2.0 provider. Users link multiple identities to one account — federation without migration.

User Federation

Synchronize users from existing external directory servers without migration. Custom user storage adapters available via Integration & Tuning scope.

Role-Based Access Control

Role-based authorization with policies per application. Centralized permission management — enforced consistently across all services connected to the platform.

Multi-Tenant Realms

Isolated realms for each tenant, department, or environment. Each realm has its own users, roles, clients, and security policies — realm-level isolation.

Admin Console

Web-based administration for users, roles, clients, realms, and policies. Configure identity brokering and federation from a single Identity Portal interface.

User Self-Service

End-user portal for password reset, profile updates, MFA setup, and session management — reducing help desk tickets and IT overhead.

Audit Trail

Full audit log for login events, permission changes, and admin actions. Session and device management. Realm import/export as JSON for backup and migration.

Client Registration

Register OAuth/OIDC clients manually from the Identity Portal or via CLI tooling. Streamlines onboarding of applications and services into the identity stack.

PDN / TKDN Compliance

Indonesian data sovereignty positioning. Supports PDN / TKDN compliance requirements (subject to official certificate). Deploy in Indonesian data jurisdiction.

mTLS

TLS 1.3 in transit with auto-renew. AES-256 encryption at rest. Argon2/PBKDF2 password hashing. Mutual TLS (mTLS) support for service-to-service authentication.

USE CASES

Built for Every Identity Challenge

Designed for organizations that need to own their identity data, sessions, and audit trail end-to-end.

Enterprise SSO & IAM

Centralize authentication across all internal applications. **SSO eliminates password fatigue** and reduces help desk costs. Federate with existing directory servers without migration. Identity Portal streamlines user lifecycle — onboarding, role changes, offboarding.

Government & Industries

Self-hosted on-premise for **complete data sovereignty**. Airgapped deployment with no external dependencies. MFA enforcement, full audit trail, and **PDN / TKDN compliance support**. Realm isolation for classified environments.

Multi-Tenant Platforms

One realm per tenant for realm-level isolation. Identity brokering for customer-facing apps. Self-service password reset, profile updates, and MFA enrollment via the Identity Portal. CLI tooling for client registration and automated onboarding.

API & Microservices Security

Secure APIs with OAuth 2.0 and JWT tokens. Centralized token issuance, validation, and revocation. Service-to-service authentication via mTLS. Integrate with API gateways and reverse proxies for zero-trust architectures.

UNDER THE HOOD

Standards-based IAM. Sovereign by deployment.

NQRust-Identity acts as a centralized authentication server. When a user accesses any connected application, they are redirected to the Identity Server login page. After authentication, a **temporary code** is exchanged for ID, access, and refresh tokens (JWT) — the application never sees the user's password.

Realms provide multi-tenant isolation. Each realm is an independent identity domain with its own users, roles, clients, authentication flows, and security policies. The master realm manages the platform itself; application realms serve your tenants and departments.

The platform runs as a **Docker Compose** stack with the Identity Server and Identity Portal containers connected to a backend database. Every component is deployable on your own infrastructure — from a single host to multi-instance setups configured under **Integration & Tuning**.

WHY NQRUST-IDENTITY

More Than IAM. A Sovereign Choice.

Centralize identity, secure every application, and own every byte of identity data that flows through your organization.

Centralized Security

One identity platform for all applications. SSO, MFA, and authorization policies managed from a single admin console. Developers focus on business logic, not security implementation.

Data Sovereignty & PDN

Self-hosted on your infrastructure. All user data, tokens, and sessions stay on-premise. PDN / TKDN compliance support. Deployment in Indonesian data jurisdiction. Airgapped option for classified environments.

Standards-Based & Integrable

Built on OAuth 2.0, OpenID Connect, and SAML 2.0. Integrates with any application, framework, or language. Custom adapter integration and mTLS setup available via Integration & Tuning scope.

Predictable Flat Annual Pricing

Flat annual subscription in IDR. No per-user-per-month surprises. No FX exposure. One price covers the full stack — Identity Server, Identity Portal, NQRust Auth, and installer. Local support included.

Ready to own your identity stack?

Contact our sales team for a tier quotation, Integration & Tuning scope, and guided installation. Quotes returned within 48 hours.
